HIGHLIGHTS

Federal R&D Facilities for Entrepreneurs and Innovators

View this Dataset

As part of the Administration's <u>Lab-to-Market initiative</u>, agencies are publishing machine-readable data on over 700 Federal R&D facilities that may be utilized by entrepreneurs and innovators to research, prototype, and test new technologies. These facilities, operated by <u>NASA</u>, the <u>Department of Energy (DOE</u>), and the <u>National Institute of Health (NIH)</u>, include cutting-edge research tools and together represent billions of dollars of taxpayer investment.

Each faillity has its own set of use policies, so a contact person is included in the data wherever possible. For example, some entrepreneurs may be able to access NASA's National Center for Advanced Manufacturing to produce the high-strength, defect-free joints required for cutting-edge aeronautics, or DOE's Manufacturing Demonstration Facility at Cak Ridge National Laboratory for collaborative projects in additive manufacturing, composites and carbon fiber, and other leading clean energy technologies. <u>Learn</u> more...

La Ciencia la hacemos entre todos

Participa con tu opinión, experiencias y conocimiento en la definición de una Política de datos abiertos para las investigaciones científicas.

¿Cómo garantizar el acceso a información y datos científicos?

Chile necesita una política de acceso y preservación de información y datos de investigaciones científicas financiadas con fondos públicos. CONICYT ha elaborado una propuesta, pero nécesitamos su opinión para perfeccionaria.

World Data System (WDS)

- tags: International Research Collaboration, Data and information, Universality of Science, Science for Policy

The ICSU World Data System (WDS) was created through a decision of the 29th General Assembly of the International Council for Science (ICSU).

Building on the 50-year legacy of the ICSU World Data Centres (WDCs) and the ICSU Federation of Astronomical and Geophysical data-analysis Services, the WDS aims at transitioning from existing stand-alone data centres and data services to a common, globally interopenable, distributed data system that incorporates emerging technologies and new scientific data activities.

The new system builds on the potential offered by advanced interconnections between data management components to foster disciplinary and multidisciplinary applications for the benefit of the international scientific community and other stakeholders.

As of 9 September 2016, WDS has 98 Member organizations, including 64 Regular Members, 10 Network Members, 6 Partner Members and 18 Associate Members, and numerous other applications continue to be reviewed by the WDS Scientific Committee (see: www.icsu-wds.org/community/membership)

ABOUT

Linked Science is an approach to interconnect scientific assets to enable transparent, reproducible and transdisciplinary research.

LinkedScience.org is a community driven-effort to show what this means in practice.

LinkedScience.org was founded early 2011 and is led by <u>Tomi Kauppinen</u> pinen affiliated 2010-2012 with the <u>Institute for Geoinformatics</u> at the <u>University of Muenster</u> (Germany) and since Autumn 2012 with the <u>Department of Media Technology</u> at the <u>Aalto University</u> (Finland), and from April 2014 to September 2014 with the University of Bremen (Germany).

What is the OSDC? >> Watch a Video

OSDC in brief

The Open Science Data Cloud provides the scientific community with resources for storing, sharing, and analyzing terabyte and petabyte-scale scientific datasets. The OSDC is a data science ecosystem in which researchers can house and share their own

Why is there a need?

With datasets growing larger and larger, researchers are finding that the bottleneck to discovery is no longer a lack of data but an inability to manage, analyze, and share their large datasets. Individual researchers can no longer download and analyze the

 SCIENTIFIC DATA
 Scient Scientific data > about
 Scient Scientific data > about

About

Scientific Data is a peer-reviewed, open-access journal for descriptions of scientifically valuable datasets, and research that advances the sharing and reuse of scientific data. Read our key principles >

Scientific Data welcomes submissions from a broad range of research disciplines, including descriptions of big or small datasets, from major consortiums to single research groups. Scientific Data primarily publishes Data Descriptors, a new type of publication that focuses on helping others reuse data, and crediting those who share. Read our aims & scope >

All content is hosted on nature.com – the destination of millions of scientists globally every month. Publications are indexed in PubMed, MEDLINE and Google Scholar, and are automatically deposited into PubMed Central.

Editors, Advisory Panel and Editorial Board

Scientific Data is supported by a diverse group of researchers, funders and librarians, who form our Advisory Panel and Editorial Board.

Is there a common framework where these problems can be studied and (hopefully) solved?

The Semantic Web is a common framework to tackle these issues

"The Semantic Web is an extension of the current web in which information is given well-defined meaning, better enabling computers and people to work in cooperation."

[Tim Berners-Lee et al. 2001.]

"The Semantic Web is an extension of the current web in which information is given well-defined meaning, better enabling computers and people to work in cooperation."

[Tim Berners-Lee et al. 2001.]

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Specific goals:

"The Semantic Web is an extension of the current web in which information is given well-defined meaning, better enabling computers and people to work in cooperation."

[Tim Berners-Lee et al. 2001.]

Specific goals:

Build a resource description language with standard semantics

"The Semantic Web is an extension of the current web in which information is given well-defined meaning, better enabling computers and people to work in cooperation."

[Tim Berners-Lee et al. 2001.]

Specific goals:

- Build a resource description language with standard semantics
 - Make semantics machine-processable and understandable

"The Semantic Web is an extension of the current web in which information is given well-defined meaning, better enabling computers and people to work in cooperation."

[Tim Berners-Lee et al. 2001.]

Specific goals:

- Build a resource description language with standard semantics
 - Make semantics machine-processable and understandable
- Incorporate logical infrastructure to reason about resources

Prefixes simplify the notation

Prefixes can be defined in an RDF graph to simplify notation

They are defined also using triples

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Prefixes simplify the notation

Prefixes can be defined in an RDF graph to simplify notation

They are defined also using triples

We can include in an RDF graph the following triples:

@prefix owl: <http://www.w3.org/2002/07/owl#> .
@prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#> .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Prefixes simplify the notation

Prefixes can be defined in an RDF graph to simplify notation

They are defined also using triples

We can include in an RDF graph the following triples:

```
@prefix owl: <http://www.w3.org/2002/07/owl#> .
@prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#> .
```

Then <http://www.w3.org/1999/02/22-rdf-syntax-ns#type> can be replaced by rdf:type

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

We do research on all the areas mentioned before.

With an emphasis on their scientific aspects

But we are also interested in developing prototypes incorporating our results

・ロト ・西ト ・ヨト ・ヨー うらぐ

We do research on all the areas mentioned before.

With an emphasis on their scientific aspects

But we are also interested in developing prototypes incorporating our results

Let me show you two of our applied projects ...

Detecting and measuring the impact of earthquakes using social sensors

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Why do we use Social Media?

- Communicative nature
- Twitter is largely used in mobile devices

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Users use Twitter like a news source

What is a social sensor?

- Each Twitter user is a social sensor
- Social sensor detects an event and publish a post (without a known pattern)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Very noisy type of sensor

- One of the most seismic countries in the world
- One of the top-ten highest Twitter users per capita
- Seismological Center of University of Chile is very interested

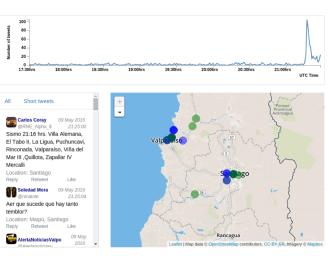

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

What do we want to do?

- Offer to Seismological Center of University of Chile a tool to explore earthquake related data
- Complement earthquakes information using tweets data such as location names, opinions about the event and sentiments

Visualization tool

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Visualization tool

Results

- Currently the system detects earthquakes over 4 in Richter scale
- It throws alerts in less than 2.5 minutes in the worst case
- The platform allows to observe Twitter information only a few seconds after an earthquake strikes
- Geographical visualization has high granularity level although a lot of data are not obtained by GPS

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Open data and the Chilean constitutional process

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Open data and the Chilean constitutional process

A basis for a new constitution.

 Effort to create a new Constitution via several small assemblies countrywide

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

But the data gathered from the process was not really open

We created a Web repository to:

- analyze and visualize the (small) data available
- raise awareness of the importance of opening the data of this process

Web site: http://constitucionabierta.cl

http://constitucionabierta.cl

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ─臣 ─ のへで

Our efforts helped to make the government to open the data of the process

Today there is public access to (anonymized) data of

- Political opinions of 8.000 groups (of 10-30 people)
- Individual opinions of 80.0000 participants
- > 2 million "constitutional concepts" prioritized

We have processed this data and cooperated with several public and social organizations

Thank you!

Working with highly distributed data

▲□▶ ▲圖▶ ▲圖▶ ▲圖▶ = ● ● ●

Web data is highly distributed

Data can be stored in different repositories

Different pieces of data have to be collected to answer a query

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Web data is highly distributed

Data can be stored in different repositories

Different pieces of data have to be collected to answer a query

An important notion to deal with this issue: SPARQL endpoint

A Web service that accepts a SPARQL query as input, and returns (part of) the result to the query

Web data is highly distributed

Data can be stored in different repositories

Different pieces of data have to be collected to answer a query

An important notion to deal with this issue: SPARQL endpoint

A Web service that accepts a SPARQL query as input, and returns (part of) the result to the query

SPARQL has an operator SERVICE to query an endpoint

The SPARQL endpoint of DBpedia

Virtuoso SPARQL Query Editor

Default Data Set Name (Graph IRI)

http://dbpedia.org

Query Text

(Security restrictions of this server do not allow you to retrieve remote RDF data, see details.)

Results Format: HTML

Execution timeout: 30000 milliseconds (values less than 1000 are ignored)

Options: Strict checking of void variables Log debug info at the end of output (has no effect on some queries and output formats)

(The result can only be sent back to browser, not saved on the server, see details)

Run Query Reset

Querying DBpedia

The answer to the query

SPARQL results:

name	
"Sanjeev Saxena"	
"Hans-Ulrich Simon"	
"Nathan Goodman"	
"Oded Shmueli"	
"Norbert Blum"	
"Arnold Schönhage"	
"Juha Honkala"	
"Chua-Huang Huang"	
"Christian Lengauer"	

We would like to combine the previous results ...

```
SELECT ?name
WHERE.
ł
  ?actor rdf:type <http://dbpedia.org/class/yago/AmericanActors>
  ?actor foaf:name ?name .
  SERVICE <http://dblp.13s.de/d2r/sparql>
  ł
     SELECT ?name
     WHERE.
     Ł
        ?paper dc:creator ?author .
        ?author foaf:name ?name .
     }
  }
```

Open issues when dealing with distribution

Some important problems:

The notion of SPARQL endpoint needs to be formalized

- What queries are accepted?
- How is the time distributed between them?
- Should a pricing model be used?
- What is the protocol to return the answer to a query?

A more general notion of endpoint should be formalized and studied

Open issues when dealing with distribution (cont'd)

- Usability needs to be hugely improved
 - schema/structure extraction and visualization play a fundamental role here

Approaches for discovering relevant data should be studied

 Operators to distribute the execution of queries should be studied in more depth

Other important problems when querying RDF

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Returning as much information as possible

RDF follows an open world assumption

Users may be unaware of the structure of the data

(ロ)、(型)、(E)、(E)、 E) の(の)

Returning as much information as possible

RDF follows an open world assumption

Users may be unaware of the structure of the data

Thus, the possibility of obtaining additional information if possible is important in this scenario

 In fact, this feature was present from the very beginning in SPARQL

An optional operator

Retrieve each movie in DBpedia and its gross if this information is available

```
SELECT ?movie ?gross
WHERE
{
    ?movie rdf:type <http://schema.org/Movie> .
    OPTIONAL
    {
        ?movie <http://dbpedia.org/property/gross> ?gross .
    }
}
```

Part of the answer to the query

?movie	?gross
http://dbpedia.org/resource/Frozen_(2013_film)	"1.274E9"
http://dbpedia.org/resource/Amazon_Souls	

<□ > < @ > < E > < E > E のQ @

What is new?

The OPTIONAL operator essentially corresponds to a left-outer join in relational algebra

▲□▶ ▲圖▶ ▲圖▶ ▲圖▶ = ● ● ●

But ...

What is new?

The OPTIONAL operator essentially corresponds to a left-outer join in relational algebra

But ...

- The fragments of SPARQL that are natural to study are different than for the case of relational algebra
 - The complexity of evaluating these fragments was not known [Pérez, A. & Gutierrez 2009; Schmidt, Meier & Lausen 2010]
- New notions of safeness are needed to avoid a counterintuitive behavior [Pérez, A. & Gutierrez 2009]
- New optimization techniques are needed [Pérez, A. & Gutierrez 2009; Letelier, Pérez, Pichler & Skritek 2013; Pichler & Skritek 2014]

Reasoning capabilities are needed

Reasoning capabilities are needed

▶ We already mentioned owl:sameAs

Reasoning capabilities are needed

- We already mentioned owl:sameAs
- An RDF graph can use RDF Schema (RDFS) to establish hierarchies of classes and properties

Reasoning capabilities are needed

- We already mentioned owl:sameAs
- An RDF graph can use RDF Schema (RDFS) to establish hierarchies of classes and properties
- The Web Ontology Language (OWL) can be used to define more complex relations between classes and properties

The following triples are included in DBpedia:

The following triples are included in DBpedia:

http://dbpedia.org/class/yago/Professor110480730
rdfs:subClassOf
http://dbpedia.org/class/yago/Academician109759069 .

rdfs:subPropertyOf
http://dbpedia.org/ontology/championInDouble .

http://dbpedia.org/ontology/championInDouble
rdfs:subPropertyOf

http://dbpedia.org/ontology/champion .

Some numbers in DBpedia:

- triples with rdfs:subClassOf as predicate are at least 450K
- triples with rdfs:subPropertyOf as predicate are at least 1K

Some numbers in DBpedia:

- triples with rdfs:subClassOf as predicate are at least 450K
- triples with rdfs:subPropertyOf as predicate are at least 1K

We need reasoning capabilities to deal with:

rdfs:subClassOf, rdfs:subPropertyOf

Some numbers in DBpedia:

- triples with rdfs:subClassOf as predicate are at least 450K
- triples with rdfs:subPropertyOf as predicate are at least 1K

We need reasoning capabilities to deal with:

- rdfs:subClassOf,rdfs:subPropertyOf
- and other elements of RDFS such as rdfs:domain and rdfs:range

Answering a query with RDFS vocabulary

Retrieve all the educators in DBpedia

```
SELECT ?educator
WHERE
{
     ?educator rdf:type
     <http://dbpedia.org/class/yago/Educator110045713> .
}
```

◆□▶ ◆□▶ ◆三▶ ◆三▶ → 三 - のへで

Answering a query with RDFS vocabulary

The answer to the previous query should be the same as for the following query:

Open issues about reasoning with ontologies

Two important problems:

- Development of efficient query answering algorithms over large RDF graphs with RDFS vocabulary
- Identification of fragments of OWL that have good expressive power and can be efficiently evaluated

Exploiting the graph structure of RDF

The structure of an RDF graph stores information

It is important to have operators that can deal with this structure

In particular, navigating an RDF graph is an important functionality

Exploiting the graph structure of RDF

The structure of an RDF graph stores information

It is important to have operators that can deal with this structure

▶ In particular, navigating an RDF graph is an important functionality

Properties paths in SPARQL allow to express reachability queries

Get starring actors in the same movie:

```
SELECT ?actor1 ?actor2
WHERE
{
     ?movie <http://dbpedia.org/property/starring> ?actor1 .
     ?movie <http://dbpedia.org/property/starring> ?actor2 .
}
```

Previous query can be rewritten by using navigation patterns:

Previous query can be rewritten by using navigation patterns:

Previous query can be rewritten by using navigation patterns:

Previous query can be rewritten by using navigation patterns:

The expression in red is called a property path

Get starring actors that are connected:

▲ロト ▲帰ト ▲ヨト ▲ヨト - ヨ - の々ぐ

Get starring actors that are connected:

Can this query be answered?

Can it be answered starting from a specific node?

Open issues in exploiting the graph structure of RDF

Some important problems:

 Development of efficient evaluation algorithms for reachability queries over large RDF graphs

 Standardization of a query language where paths are first-class citizens
